

ABSTRACT OF THE DISCLOSURE

A part (1) includes an airbag safety device (21), an instrument board element (3) formed with an extraction flap (13) of the bag, a frame (23) which is fixed to the instrument board element (3) in such a way as to form a channel (65) for guiding the unfolding of the bag, and a shutter (25) for reinforcing the flap (13), a retaining part (93) of the shutter being connected to the frame (23) by at least one retaining hook (95). The hook (95) is formed from one piece with the shutter (25), and co-operates with a complementary shoulder (87A) formed with the frame (23) when the device is triggered. The invention also relates to a method for assembling one such part (1).
